multiple sclerosis, connective tissue disease, rheumatoid arthritis, disbetes mellitus, allergic rhinitis, asthma and eczema, nervous system disorders such as Parkinson's disease, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and wernicke disease, inflammatory disorders such as nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory bowel disease. The sequences exhibit activity relating to angiogenesis, cell proliferation, cell differentiation, stem cell growth factor, activin or inhibin. Therefore, they can be used to manipulate stem cells

Sequences AAU27676-AAU28019 represent full-length polypeptides and contil polypeptides of the invention. The proteins and their associated DNA sequences are useful for the treatment, diagnosis and prevention of various types of disorder in a mammalian subject such as a human, dog, monkey, mouse, hamster or rat. The disorders include cancers such as leukaemia, lymphoma and neuroblastoma, autoimmune disorders such as

The sequences may also be used for regeneration of bone, cartilage, tendons and ligaments and in tissue repair and burn healing. Note: Some sequences for this patent did not form part of the printed specification, but were obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            117 salancunysarganaSerilenysileValThrProAspTrpValLeuA 134

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq_name: /SIDS5/gcgdata/geneseq/geneseqp-cmbl/aa2001.DAT:ABB71695
                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent. useful in developmental biology and in elucidating cell signalling (cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABENERT ABLAGA (ABL01840) and the encoded proteins
                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from

Novel polypeptides and nucleic acids obtained from cDNA libraries prepared from various human tissues, for diagnosis, treatment of cancer, neurological, inflammatory disorders and for use in arrays for

Claim 10; Page 144; 153pp; English

in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, accidental damage or genetic disorders. The sequences may also be used for regeneration of bone, cartilage, tendons and ligaments and in tissue repair and burn healing. Note: Some sequences for this patent did not form part of the printed specification, but were obtained in electronic format directly from WIPO Wernicke disease, inflammatory disorders such as nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory bowel disease. The sequences exhibit activity relating to angiogenesis, cell proliferation, cell differentiation, stem cell growth factor, activin or inhibin. Therefore, they can be used to manipulate stem cells Sequences AAU27676-AAU28019 represent full-length polypeptides and contil polypeptides of the invention. The proteins and their associated DNA sequences are useful for the treatment, diagnosis and prevention of various types of disorder in a mammalian subject such as a human, dog, monkey, mouse, hamster or rat. The disorders include cancers such as at ftp.wipo.int/pub/published_pct_sequences disorders such as Parkinson's disease, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and leukaemia, lymphoma and neuroblastoma, autoimmune disorders such as multiple sclerosis, connective tissue disease, rheumatoid arthritis, diabetes mellitus, allergic rhinitis, asthma and eczema, nervous system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (1) is useful in gene therapy techniques CC (II). (II) is useful in or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic mono acid sequences of the invention.

CC The invention relates to isolated polynucleotide (I) and CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping and in recombinant production of (II). The CC is relatifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC a food supplement. (II) and its binding partners are useful in medical CC disorders involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ΧX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq_name: /SIDS5/gcgdata/geneseq/geneseqp-emb1/AA2001.DAT:ABG19008
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  seq_documentation_block:
                                                                  diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/bublished not semimone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 20; SEQ ID No 49367; 103pp; English

                                                                                                                                                                                                 of a l'aminocyclopropane-carboxylate (ACRC) synthase polypeptide. The disease such as stroke, a nerve damage or a neurodegenerative disease. The ACRC synthase polypeptide, polynucleotides and modulators are also useful for treating brain trauma and neurodegenerative disease (e.g. Alzheimer's disease, depression, epilepsy). The ACRC synthase modulators are also are also useful for treating alcohol abuse and improve cognitive function represents the amino acid sequence of human 1-aminocyclopropane-
                                                                                                                                                                                           and memory of patients with learning impairment. represents the amino acid sequence of human 1-am carboxylate (ACPC) synthase #12, used in the met
                                                                                                                                                                                                                                                                                                                                                                    The invention relates to reagents and methods for regulating excitatory neurotransmission, and to prevent neurodegeneration. The method involves the use of an expression vector or a reagent that modulates the activity

	id detection reagent for detecting 1000 or more
	and for elucidating cell signalling
	closure; SEQ ID NO 34632; 21pp + Sequence Listing; English.
	invention relates to an isolated nucleic acid detection reagent
	a
	ecticides, therapeutics and pharmaceutical drugs. The invention closes genomic DNA sequences (ABL16176-ABL305111), expressed has
	uences (AHL01840-ABL16175) and the encoded proteins
	Sequence data for this patent did not form part of the printed
	specification, but was obtained in electronic format directly from WIPO at flp.wipo.int/pub/published_pct_sequences.

```

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                                                                                                               AAY60558 standard; Protein; 169 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as inaging of sites expressing (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess blockiersity and to produce other traits to assess blockiersity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                        74 Leu 74
                                                                                                                                                                                                                                                                                                                                                                                      72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC This invention describes novel polypeptide fragment sequences (I) and CC their encoding nucleic acids (II) which are highly expressed in normal CC bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, CC used to identify agents suitable for the treatment of bladder tumours, cc therapy vectors), or are used in a preparation for cancer treatment. (I) cc identified by assembling EST'S (expressed sequence tags) from a slow as significantly longer fragment of the gene to be revealed, and CC therefore reduces the number of failures because of EST'S from different CC anykonyone conversed the same unknown gene CC AAY60329 Y60591 represent parts of the same unknown gene CC CAAY60329 Y60591 represent protein fragments encoded by the human normal cCC bladder tissue cDNA library derived EST fragments represented in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               alignment_scores:

The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of inscorticidae thereouting and charmanchical dense thereouting and charmanchical dense thereouting and charmanchical dense thereouting the contraction of the development of t at ftp.wipo.int/pub/published_pct_sequences. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO Sequence ABB57737-ABB72072) Quality: Ratio: 517 AA; 1.278 50.448 216.00 from: 1 Length: 335

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polyperase chain reaction (PCR) primers oligomers, and for chromosome CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and cs (II) and its binding partners are useful in medical CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations and polynucleotide sequences have applications in CC and to produce other types of data and products dependent on DNA and CC diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human CC Mote: The sequence data for this patent did not appear in the printed CC specification, but was obtained not sequences format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_documentation_block:
